

Course title: Environmental Modeling				
Course code: NRE 171		No. of credits: 4	L-T-P: 42-14-0	Learning hours: 56
Pre-requisite course code and title (if any): NRE 131 Environmental Chemistry and Microbiology				
Department: Department of Energy and Environment				
Course coordinator: Prof. Prateek Sharma			Course instructor: Prof. Prateek Sharma	
Contact details: prateeks@terisas.ac.in				
Course type: Elective			Course offered in: Semester 3	
Course Description The environmental problems result from a complex interaction of physical, chemical and biological processes, involving land, water, air and energy resources that significantly affect human activities and attitudes. The complex and multidisciplinary nature of environmental problems requires that they are dealt in an objective and integrated manner. Quantitative tools provide the requisite objectivity in environmental decision-making. These tools help in investigating, understanding, representing the current and predicting the future state of environment and generating 'what-if' scenarios under alternative policy interventions. These are crucial for any integrated environmental assessment and management strategy. This course aims to provide introduction to the fundamental modeling concepts and their applications in simulating the pollutant fate and transport problems in the natural environmental systems.				
Course objectives 1. Understand the idea, methodology and basic tools of environmental modeling 2. Understand the different modeling approaches, their scope and limitations 3. Understand the fate and transport of pollutants 4. Become aware of a wide range of applications of modelling in environmental management & decision making				
Course content				
Module	Topic	L	T	P
1.	Introduction Environmental modelling: scope and problem definition, goals and objectives, definition; modelling approaches-deterministic, stochastic and the physical approach; applications of environmental models; the model building process	6	2	
2.	Elementary concepts, laws, theories and processes The building blocks: extensive and intensive properties, properties relevant to of environmental systems, the material balance approach; the transport processes- advection, diffusion, dispersion, gravitational settling, transport in porous media; the transformation processes-the non-reactive processes, the reactive processes; simulation of transport and transformation processes-introduction, the completely stirred tank reactor, plug flow reactor, mixed flow reactor models; the general material balance models.	12	4	
3.	Environmental modelling - applications Water quality modelling: surface water quality modelling -	24	8	

	lakes and impoundments, rivers and streams, estuaries; ground water pollution modelling. Air quality modelling: the box model, the Gaussian plume model point sources, line sources, area sources; special topics; Gaussian puff model			
	Total	42	14	
Evaluation criteria				
<ul style="list-style-type: none"> ▪ Test 1: 20% ▪ Test 2: 20% ▪ Tutorials: 20% ▪ Test 3: 40% 				
Learning outcomes				
<ul style="list-style-type: none"> • develop models based on the mass-balance approach • predict the impact of the of external waste loading on different environmental matrices • predict and generate future conditions under various loading scenarios or management/intervention action alternatives 				
Pedagogical approach				
Materials
